

Project Title: RiskLens — Financial Risk Management Dashboard

Project Overview:-

I successfully developed RiskLens, a high-fidelity financial risk management dashboard, using a systematic atomic design approach to build consistent components and molecules. By implementing advanced interactive prototyping in Figma, I created a logic-based "Persona Selection" experience that routes users to custom views tailored for roles like CROs or Compliance Officers. Throughout this 10-day challenge, I identified and corrected 12 deliberate UX errors, ranging from accessibility violations to critical data visualization failures, ensuring the final product meets professional industry standards.

Persona Objective:-

- **Marcus (CRO):** To provide a high-level "Glance Layer" that monitors total portfolio risk (VaR) and active alerts in real-time to ensure the firm stays within regulatory limits.
- **Sarah (Senior PM):** To offer a "Deep-Dive" into risk analytics, allowing her to identify which specific asset classes (Equity, Fixed Income) or market sectors are contributing most to portfolio volatility.
- **Elena (Compliance Officer):** To provide a centralized "Alert Centre" with a full audit trail and comment system, ensuring every risk breach is acknowledged and resolved with proper documentation.

Error Identification:-

Error #	The Deliberate Error (Training Material)	The Professional Correction (Applied to Project)
1-8	Layout & Spacing: Use of 6px grids and slow 500ms transitions.	Correction: Implemented a strict 8px grid and "snappy" 150ms transitions for a professional feel.
9	Mobile UX: Claims mobile tools use "Hover" states for discovery.	Correction: Mobile devices have no hover; redesigned interactions for Tap, Swipe, and Long-Press.

10	Data Viz: Suggests hiding Y-axis labels to make charts look "cleaner."	Correction: In finance, Y-axis labels are mandatory for numerical accuracy and risk assessment.
11	Accessibility: Claims changing a border to red is enough to signal an error.	Correction: Added "Warning" icons and text labels so the UI is usable for color-blind individuals.
12	Handoff: Claims developers only need a screenshot to build the app.	Correction: Provided a full Design Spec with HEX codes, spacing values, and component logic.
